

## What's New in Mailit 7

Mailit 7 is a FileMaker 10-17 plug-in for Windows and Mac OS X that integrates full email capability into your FileMaker 10-17 solutions with ease.

Mailit 7 brings the following enhancements over Mailit 6. For More information on Mailit 7 see:

<http://www.dacons.net/mailit>

### IMAP search

- With Mailit 7 search can now be performed in a selected IMAP folder to return batch of messages matching the given search criteria e.g. "from", "since", "unread" etc. to build more professional e-mail solutions.

Functions for this feature:

Emai\_ImapSetSearch

Emai\_ImapClearSearch

### Use HTML Templates

- Especially for mass mail, Mailit 7 enables using HTML templates generated outside FileMaker. Variables can be replaced dynamically by database field content. This is the easiest way to set up and use state-of-the-art HTML mailings with personalized content. In addition HTML export is now enhanced to export images.

Functions for this feature:

Main function:

Emai\_ImportHTMLFile

Secondary function:

Emai\_ImportHTMLAttachmentCount

Emai\_ImportHTMLAttachmentPath

## **Embedded Images**

- Now images can be embedded Base64-encoded inline in HTML. This allows for enhanced display of HTML emails with FileMaker® Web Viewer. Function for this features (updated from Mailit 6):

Emai\_ExportHtml

## **Script Steps**

- As an additional option to the existing way to use plug-in functions Mailit 7 now offers all its functions as script steps. This function is available with FileMaker 16 and up.  
Script Steps significantly expand the possible actions that can be performed and make scripting easier. All functions are still available as an external function. No changes to existing solution are required.

## **Instant use of new Mailit 7 in your solutions.**

- The transition from Mailit 6 to Mailit 7 is very easy, and the only reason to modify the scripting code is to benefit from the new features, introduced in Mailit 7.
